

## Comments

### Check for Understanding - End of Lesson

1. How does the Python interpreter know what lines of code to skip?  
The Python interpreter skips any line that starts with the `#` symbol. These lines are comments, so Python ignores them and does not run them.
2. Why don't you want to have too many comments?  
Too many comments can make code messy and harder to read. Good code should be clear by itself, and comments should only be used when really needed.
